

Sharing is fun!

Thoughts on open access research

Mike Godfrey
University of Waterloo

Two experiences

- **GXL**
 - Ric Holt, Andy Schürr, Susan Sim, Andreas Winter, many others
 - c. 1999
- **What's in a name?**
 - Abram Hindle, Neil Ernst
 - c. 2011

Why share your research artifacts?

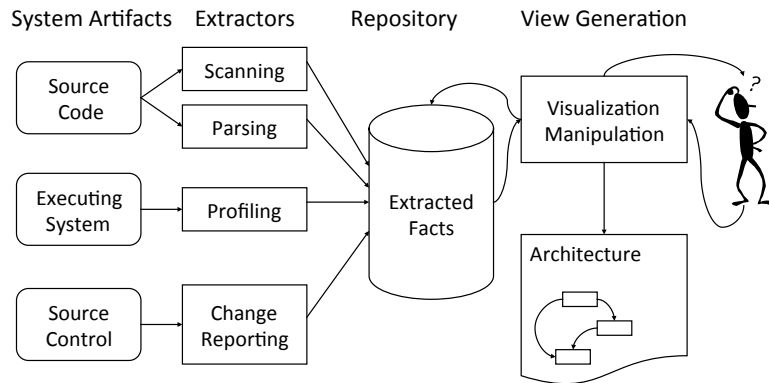

- So the community can *validate* your results
- So the community can *build on* your results
- It *improves your visibility* in the research community

Project 1: GXL

- Background: late 1990s, lots of research source code reverse engineering environments emerging:
 - e.g., Rigi/Shrimp, SwagKit/PBS, Bauhaus, MOOSE, GuPro, Datrix, Dali, CIA/Acacia ...

Architectural Reconstruction

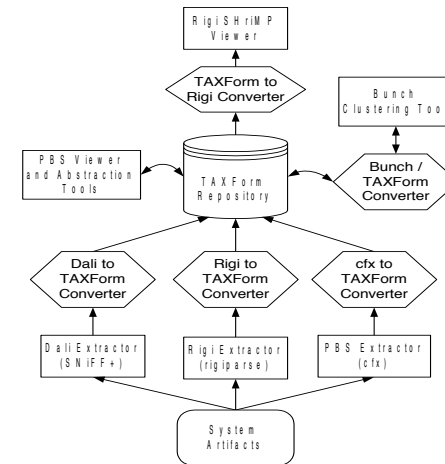

November 7, 1999

CSER / CASCON 1999

Let's share our tools!

- "I want to use your source code fact extractor with my analysis engine ... how hard can that be?"
 - "Just make your tools available for download!"
 - "Just make your APIs and output data format public!"
 - "Just make your source code available!"
 - "Just show me your main internal meta-model!"
 - "OK, maybe we need to talk ..."

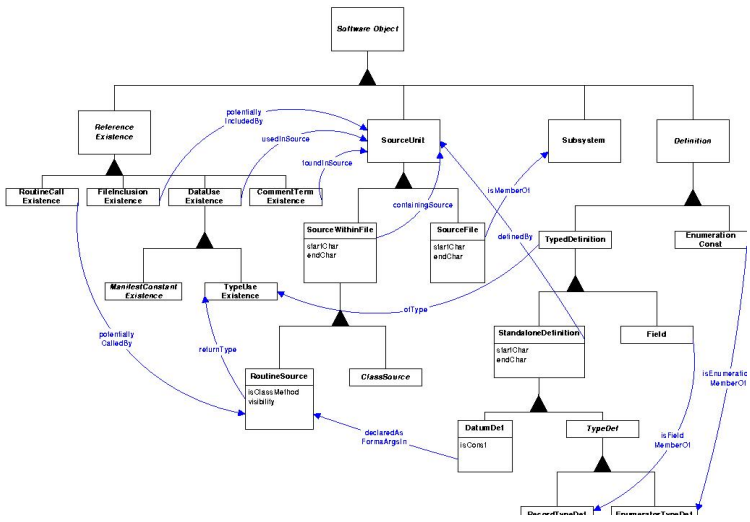

PBS C Language E/R View

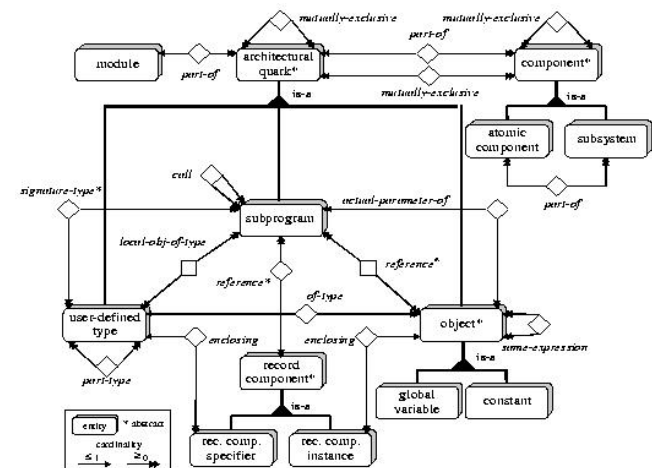

PBS Architectural Schema

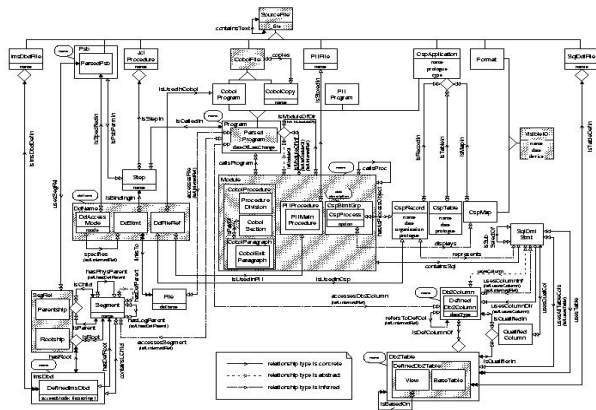

TA++ Combined E/R Model

BAUHAUS Combined E/R

GUPRO Multi-Language Model

Some problems

- To pre-process or not?
- Templates/generics are a bear
- Are interfaces classes? It's important ...
- Naming, UIDs, mangling
- Lies my extractor told me

Let's share our tools!

GXL

- Key events
 - CASCON 1999 / 2000 workshops on tool interoperability
 - ICSE 2000 Workshop of Std Exchange Formats (WoSEF)
 - Dagstuhl Seminar 01041, Interoperability of Reverse Engineering Tools, Jan 2001
- Months of discussion + arguing led to three levels:
 1. Software architecture
 2. "Middle model" (f calls g, h uses v)
 3. "Code level"

PLUS a XML-based notation that can be used to represent all three: GXL

- After arguing and arguing, we realized that all we could really agree on as a community is that models of programs are graphs
- GXL: Graph eXchange Language
 - It's XML!
 - It's not XMI!
 - ... but, ummm, BYO schema!

Success! ...

- Some tool owners created GXL converters for their tools, but its use fizzles out
- It's a headache to maintain inter-tool compatibility when you're doing active research and keep changing your mind (and others do the same)
 - That's the nature of research!
 - Probably this works best with "stable" tools

Success! ...

- So this "sharing" turned out to be a lot harder than it looked, even with a lot of good will and energy
- Instead of building large, robust bridges, we built a raft factory
 - And that was good enough for its purpose
- Most importantly, we learned a lot about what to do "next time"

Project 2: What's in a name?

- Can we label/name topics automatically extracted from version control meta-data?
- For a given LDA topic, can we label it with non-functional requirements (NFRs) automatically + without training?
- ... semi-automatically?

Ref: "Automated Topic Naming: Supporting Cross-project Analysis of Software Maintenance", by **A. Hindle, N. Ernst**, M. Godfrey, J. Mylopoulos. *Empirical Software Engineering*, 18(6), December 2013.

What's in a name

- Abram Hindle is a big advocate of open access, wants to set a good example:

http://softwareprocess.es/static/What's_in_a_Name.html

- Source code for original tools
- Original data (MaxDB repo: 1GB)
- Extracted data
- Tool output (LDA topics)
- VirtualBox VM (LDA, other tools + data preloaded: 3GB)
- Wordnet-like list for NFRs (Please reference if you use it!)

Lessons learned and open sores

- It is our moral duty as scientists to be open
- Assume no one will care, but someone might
- Sharing is hard!
 - You can "design for sharing", but it takes effort
 - You will get better at it

Sharing is fun!
